

# Arrow Functions

## Arrow Functions

- Arrow functions are an alternate way of declaring functions
- AKA **fat arrow** or **Lambda** functions
- Defined as:  

```
let myFunc = () => {};
```
- Key features:
  - Lexically captures the meaning of “this”
  - Lexically captures the meaning of “arguments”
  - They are non-constructable (i.e. cannot be invoked with the keyword “new”)
- Especially useful in typescript to access the member variables through callbacks and promises
