

exports

*Means to expose the declarables and
imported Angular Modules from an
Angular Module.*

app.module.ts ✕

```
1 import { BrowserModule } from '@angular/platform-browser';
2 import { NgModule } from '@angular/core';
3
4 import { AppComponent } from './app.component';
5 import { CoreModule } from './core/core.module';
6 import { SharedModule } from './shared/shared.module';
7 import { AppRoutingModule } from './app-routing/app-routing.module';
8
9 @NgModule({
10   declarations: [ AppComponent ],
11   imports: [ BrowserModule, CoreModule, SharedModule, AppRoutingModule ],
12   exports: [],
13   entryComponents: [],
14   providers: [],
15   bootstrap: [AppComponent]
16 })
17 export class AppModule { }
```

exports

- `exports` accepts a set of:
 - `declarables` registered on an `Angular Module`
 - `Angular Modules` imported by it to be exposed from it.
- Exported declarations are the module's public API.
- `Angular Module(Module A)`, if added to the exports of another `Angular Module(Module B)` would make the exported declarations of `Module A` a part of the public API of `Module B`.
- Read more about the `exports` array [here](#).
